

REI Case 1

Part D

Ms. K. returns to your office after trying 3 cycles of Clomid. You had prescribed 50mg to be used each month for 3 months. She has not become pregnant but has had regular 28 day cycles.

Case Questions:

Does this patient need additional workup for infertility? If so, what will you order?

How will you optimize the Clomid regimen?

How would your approach change if she had never had menses after the first cycle of Clomid?
