

REI CASE 2

PART C

You decided at Roxanne's last visit that you would give her monthly, 10 day courses of Provera, for endometrial protection. She was doing well and had bleeding over the last 4 months, but has not had any bleeding for the last 2 months despite use of the medication.

Her physical exam is basically the same as her first visit. Her weight is currently 95lbs.

Case Questions:

1. What are possible causes for her sudden lack of response?
2. Do you need any further evaluation now?
3. Do you need to treat her amenorrhea? If so, how?
4. What long term issues does she face?
